

PRODUCTION IMPLEMENTATION REPORT

Sajivo

Role-based interior project marketplace

End-to-end account hierarchy, Supabase integration, project branching, protected dashboards, private file storage, and Vercel production verification.

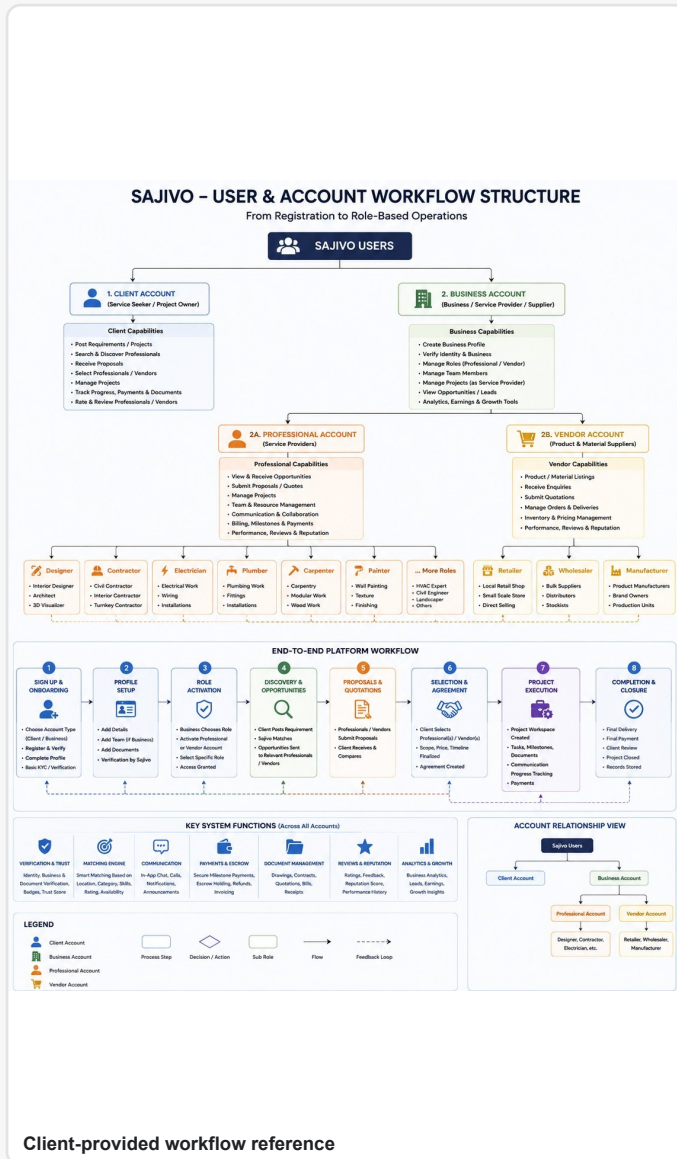

DELIVERY STATUS

Live application, connected database, verified storage, documented workflows

PRODUCTION DEPLOYED

Account hierarchy implemented

Two top-level accounts with constrained phase-one business roles

- Top-level registration now exposes only Client Account and Business Account.
- Client Account maps to the service-seeker/project-owner role and can publish briefs, compare proposals, manage workspaces, and review outcomes.
- Business Account branches into Professional and Vendor subaccounts.
- Professional phase one is intentionally limited to Interior Designer and Contractor.
- Vendor phase one is intentionally limited to Retailer.
- Role choice is persisted in profiles, business_accounts, Auth metadata, and enforced dashboard routing.

Client account registration

Simple first decision for homeowners and project owners

- Client is the default top-level selection.
- Accessible pressed states communicate the selected account path.
- Name, email, password, consent, and password-strength checks are required.
- Successful sign-up writes Auth metadata and creates a profile through a database trigger.
- Client users receive the customer role and are redirected only to the customer workspace.
- Email confirmation remains enabled in Supabase Auth.
- Login failures no longer silently fall back to demo accounts when Supabase is configured.
- Server layouts reject cross-role dashboard URLs.

Business > Professional

Phase-one designer and contractor activation

Create your Sajivo account

Start with a client or business account. Business users then activate a phase-one professional or vendor role.

Choose your account type

Client account
Post requirements, compare proposals, and manage your project.

Business account (selected)
Offer professional services or sell interior products.

How will your business use Sajivo?

Professional (selected)
Provide design or project execution services.

Vendor
Supply products and materials to customers and projects.

Select your phase-one professional role

Interior designer (selected)
Create concepts, plans, and design proposals.

Contractor
Quote, coordinate, and execute interior work.

Account path: Business account / Professional / Interior designer

Create business account

Professional account branch **N**

d0

- Business selection reveals a second decision: Professional or Vendor.
- Professional selection reveals Interior Designer and Contractor only.
- The account-path summary prevents ambiguity before submission.
- The selected professional role becomes the primary role and roles array value.
- Professional profiles can be verified, discovered, reviewed, and associated with portfolios.
- Designer and contractor dashboards have independent route guards and navigation.
- Marketplace project reads are limited to published, receiving-proposals, or matching states.
- RLS policies constrain proposals and messages to participants.

Business > Vendor > Retailer

Constrained vendor workflow requested for phase one

The screenshot displays the 'Create your Sajivo account' form. The form is titled 'Create your Sajivo account' and includes a sub-header: 'Start with a client or business account. Business users then activate a phase-one professional or vendor role.' The form is divided into several sections:

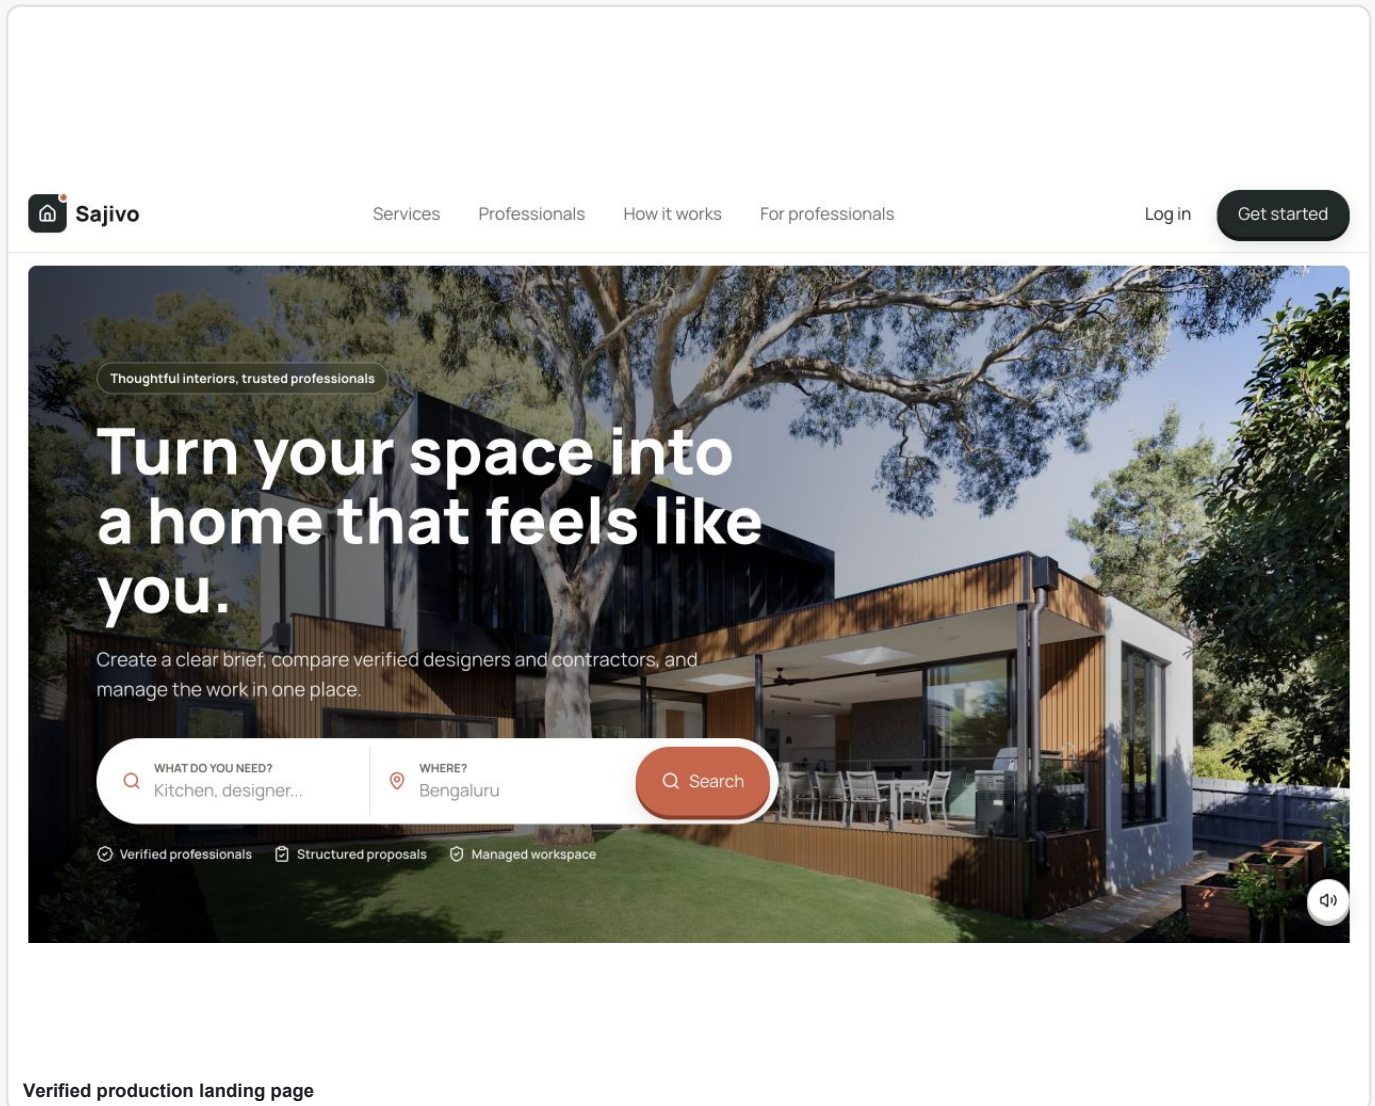

- Choose your account type:** Two options are shown: 'Client account' (Post requirements, compare proposals, and manage your project) and 'Business account' (Offer professional services or sell interior products). The 'Business account' option is selected, indicated by a red checkmark.
- How will your business use Sajivo?:** Two options are shown: 'Professional' (Provide design or project execution services) and 'Vendor' (Supply products and materials to customers and projects). The 'Vendor' option is selected, indicated by a red checkmark.
- Select your phase-one vendor role:** One option is shown: 'Retailer' (List interior products, receive enquiries, quote, and manage orders). This option is selected, indicated by a red checkmark.
- Account path:** A text field showing 'Business account / Vendor / Retailer'.
- Full name:** A text input field with a user icon.
- Email address:** A text input field with an email icon.
- Create password:** A text input field with a password icon and a toggle for visibility.
- Validation:** Two checkmarks are shown: '8+ characters' and 'One number'.
- Agreement:** A checkbox labeled 'I agree to Sajivo's terms and privacy policy'.
- Create business account:** A large orange button at the bottom of the form.

Below the form, the text 'Retailer account path' is displayed.

- Vendor is a business subaccount, never a third top-level user type.
- Retailer is the only exposed phase-one vendor role.
- Business-account constraints prevent incompatible role combinations at database level.
- Vendor registration creates both profiles and business_accounts records.
- Retailer navigation includes enquiries, quotations, orders, catalog, verification, and messages.
- Vendor product, enquiry, and order tables are owned by the authenticated vendor ID.
- Customers and vendors can read only enquiries/orders in which they participate.
- Catalog products support pricing, stock state, specifications, and image paths.

Landing and discovery entry

Airbnb-style search clarity with interior-design imagery

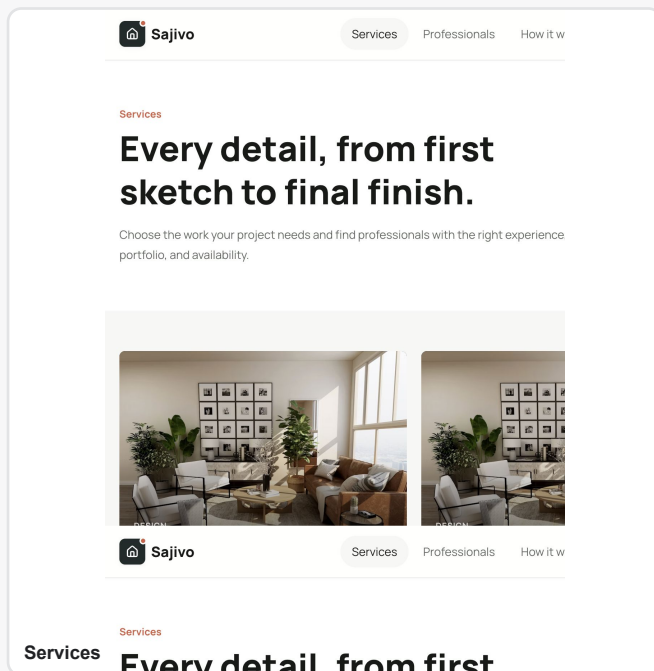

Verified production landing page

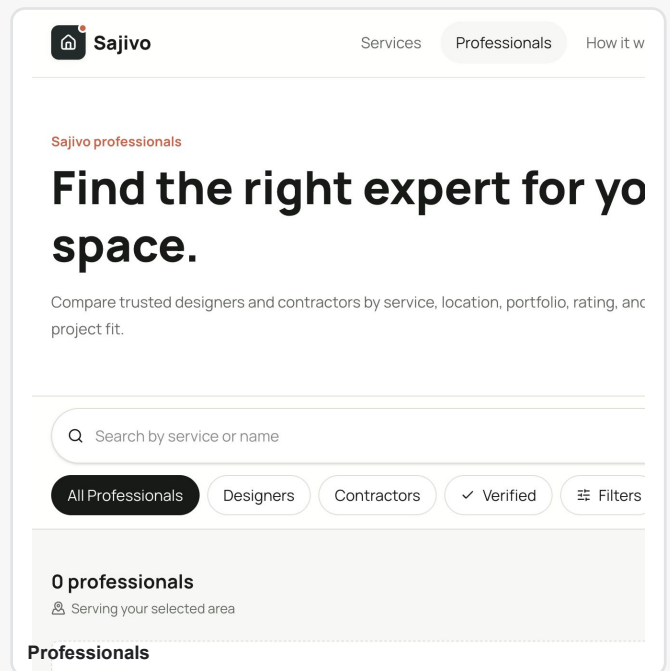

- First viewport establishes Sajivo's interior-project category with a real project image.
- Primary search captures service need and location.
- Service tiles route directly into filtered professional discovery.
- Clear calls to action lead to registration, services, professionals, and workflow guidance.
- Responsive navigation and mobile dashboard navigation follow familiar marketplace patterns.
- Interface sounds are opt-in/mutable and respect browser interaction constraints.
- Buttons use tactile depth, focus states, hover feedback, and restrained micro-motion.
- The decorative floating icon requested for removal is absent.

Services and professional discovery

Database-backed service taxonomy and honest empty states

- Six active service records are seeded in Supabase and read through `/api/services`.
- Categories include design, ceiling, wall, flooring, and execution.
- Service role scopes distinguish designer, contractor, and shared delivery categories.
- Cards use inspectable project imagery and direct discovery links.

- Professional search supports role, city, keyword, and verification filtering.
- When the live database has no verified professionals, the UI does not invent sample records.
- Professional profile architecture supports services, pricing, service areas, portfolios, reviews, and verification.
- Public reads are limited to active professional profiles.

Live customer dashboard

Help & support

Authenticated production dashboard

- Greeting is derived from the authenticated profile rather than a hard-coded demo name.
- Published, active, proposal, and unread counts use RLS-scoped database queries.
- The QA account displays two real published projects and zero proposals.
- Project progress is computed from the actual project status.
- Project cards show scope, location, timeline, service badges, budget, file count, and proposal count.
- The verified attachment project correctly displays one file.
- Notification badges disappear when the live unread count is zero.
- Cross-role navigation attempts redirect to the profile's permitted dashboard.

Scope-first project wizard

Every scope drives distinct choices in later steps

- Available scopes: Single Item, Single Room, Multiple Rooms, Complete Property, and Custom Project.
- Selecting a scope resets incompatible subtypes and service recommendations.
- The six-step rail exposes progress without allowing users to skip ahead.
- Backward navigation preserves current inputs in component state.
- Single Item narrows execution/design services to item-sized work.
- Multiple Rooms requires at least two room selections.
- Complete Property preselects broader end-to-end services.
- Custom Project requires a meaningful written requirement before continuing.

Scope-specific choices

Different buttons now produce different downstream inputs

Single Item branch

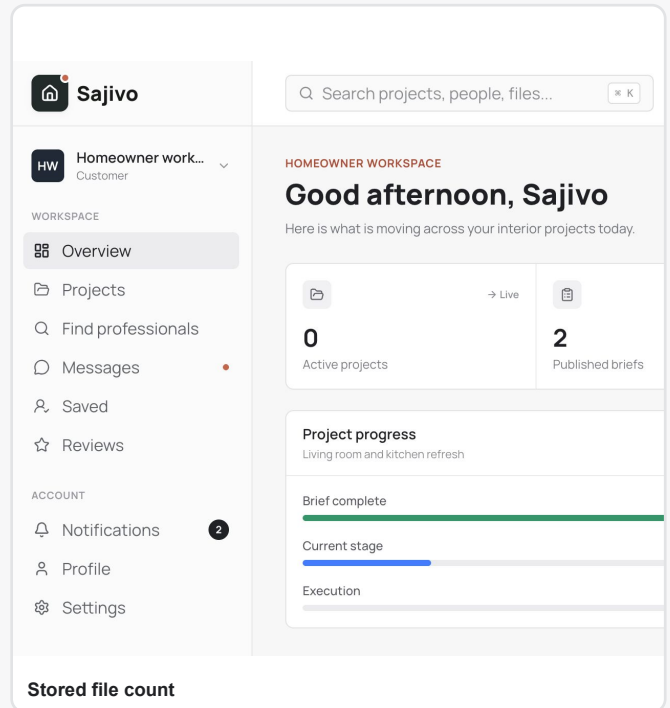

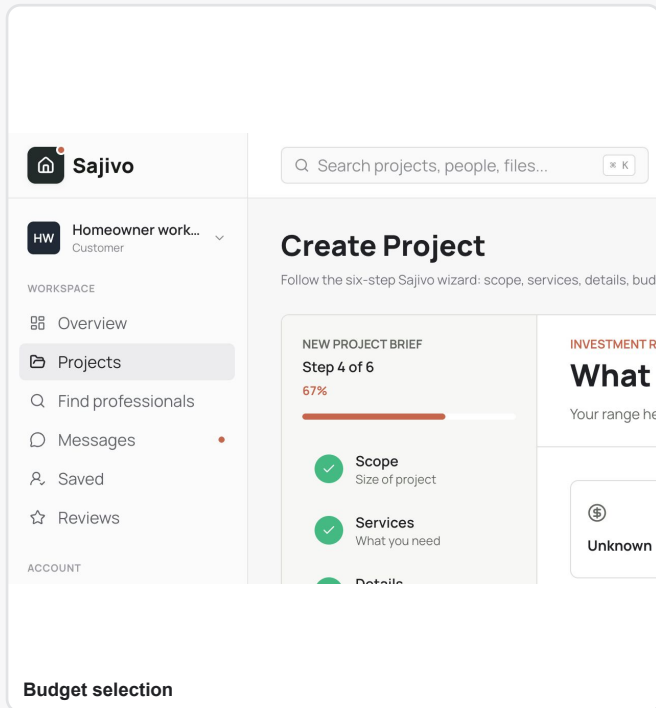

- Single Item shows item-level choices such as wardrobes, modular kitchens, surfaces, and installations.
- Only relevant service categories are displayed beneath the specific choice.
- Selections use button pressed states and check icons rather than ambiguous cards.
- The chosen subtype is stored inside the project scope JSON.

Multiple Rooms branch

- Multiple Rooms exposes selectable room chips and enforces a two-room minimum.
- The selected room list becomes the scope subtype submitted to the API.
- Custom requirements are validated at 12 or more meaningful characters.
- Validation messages appear as focused toast feedback without losing the user's work.

Details, budget, and secure attachments

Structured brief data plus private Supabase Storage

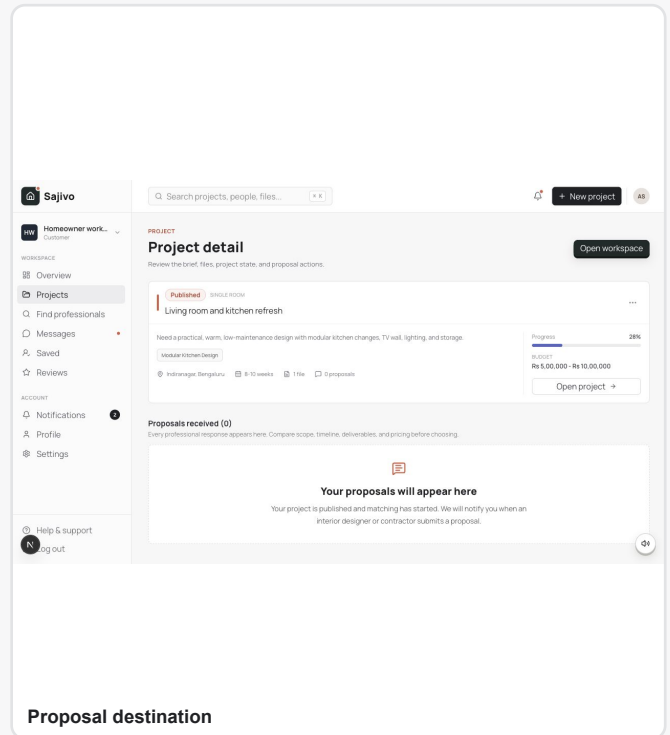

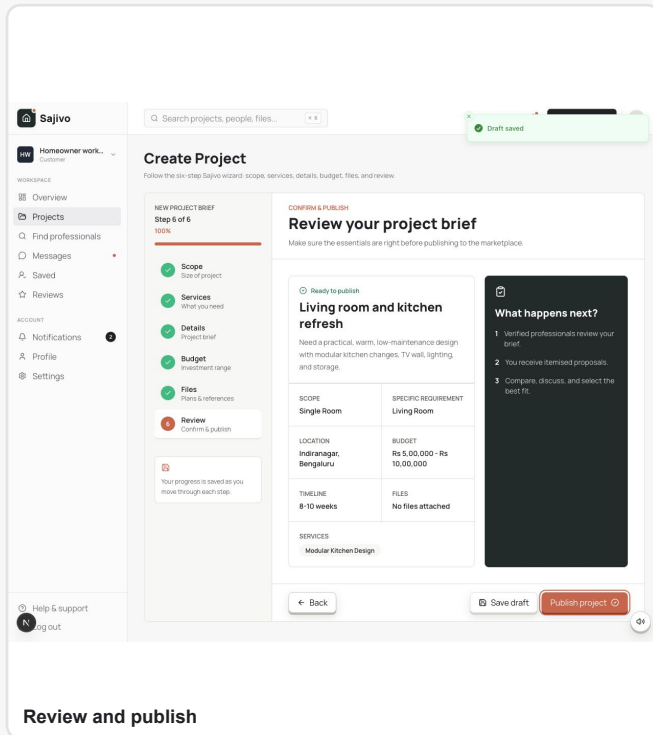

- Details capture title, description, city, locality, and preferred timeline.
- Budget ranges are explicit selectable controls and are persisted with the brief.
- Review data includes scope, specific requirement, services, location, budget, timeline, and attachment count.
- Project API validates every field with Zod before insertion.

- Attachments accept PDF, JPG, JPEG, PNG, and DWG; maximum 25 MB each and 20 files per project.
- Files upload to a private project-files bucket under user/project/UUID paths.
- project_files stores file name, MIME type, size, bucket, path, uploader, and project relationship.
- Partial uploads are removed if a later upload or metadata insert fails.

Review, confirmation, and proposal destination

A clear post-publish handoff requested by the client

- Publish inserts an authenticated project with published status and timestamp.
- A dedicated thank-you state confirms that matching has started.
- The confirmation explains matching, proposals, and selection in three short steps.
- View Proposals routes directly to the newly created project ID.

- The proposal section clearly states where future responses will appear.
- Proposal counts use Supabase aggregates normalized for PostgREST's array count shape.
- An empty state explains that verified designers and contractors can now respond.
- Project participants alone can read proposals under RLS.

Vendor dashboard and sales workflow

RLS-scoped retailer data with no fabricated metrics

The screenshot displays the Sajivo Vendor dashboard. The left sidebar contains navigation links for Overview, Enquiries, Quotations, Orders, Product catalog, Verification, Messages, Notifications, Profile, Settings, Help & support, and Log out. The main content area is titled 'Business overview' and includes a search bar, a '+ Add product' button, and a 'Business overview' section with four metrics: New enquiries (0), Open quotations (0), Active orders (0), and Conversion (0%). Below this is a 'Recent opportunities' section showing 0 records and a 'Store readiness' section showing Business profile (Connected), Catalog (0 products), Open enquiries (0), and Recorded orders (0). The footer indicates 'Retailer QA role verification'.

- Overview reports actual new enquiries, quoted value, active orders, order value, conversion, and catalog count.
- The fresh QA retailer correctly displayed zero live records and a connected business profile.
- Enquiries, quotations, orders, and catalog pages query the authenticated vendor ID.
- Each empty state explains what event will populate the table.
- Products include price, currency, stock status, specifications, image paths, and active state.
- Enquiries support requirement text, status, quote amount, and quote validity.
- Orders calculate total amount from subtotal plus tax and support delivery details.
- The retailer test used a temporary QA role and restored the account to client afterward.

Supabase schema and security inventory

Target project: mavkfhbzbbslfjrazyldl

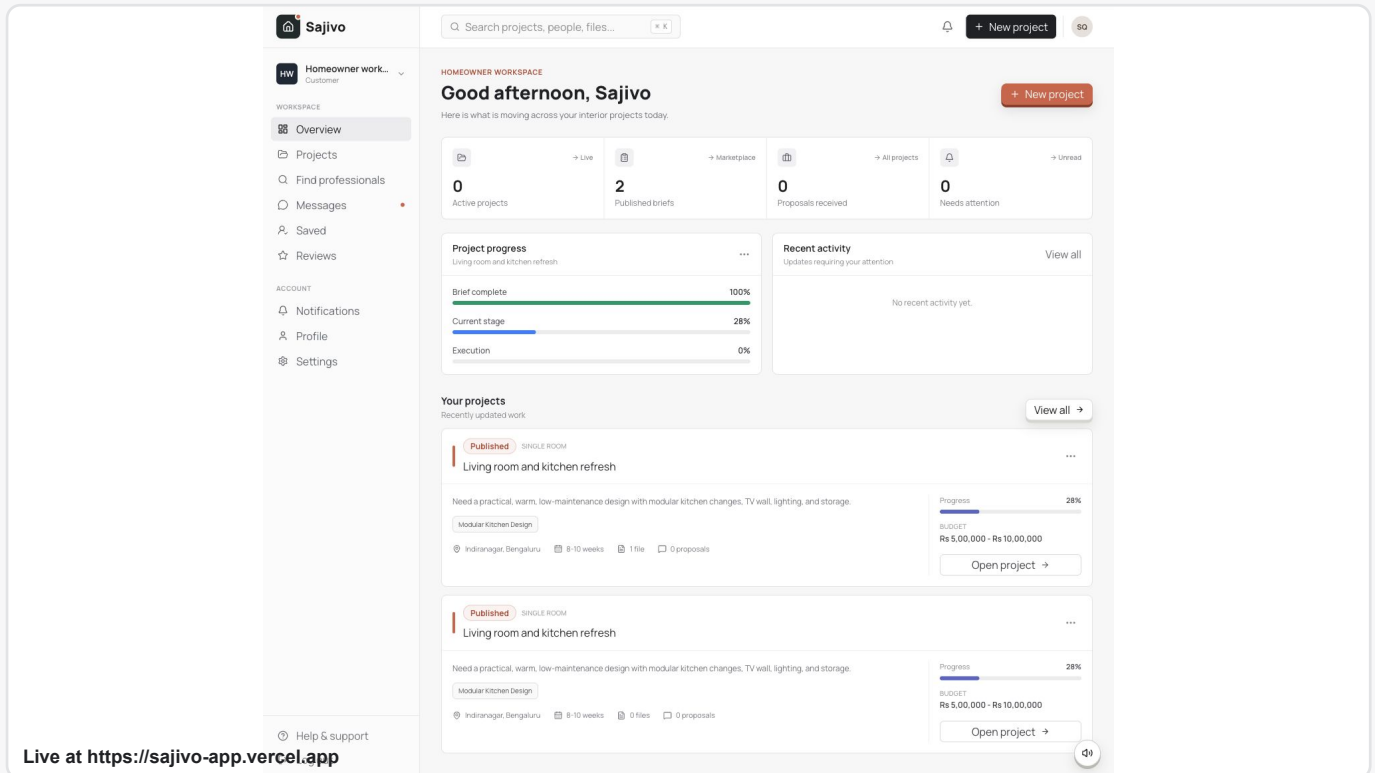

17 public tables

- profiles
- services
- projects
- project_files
- proposals
- workspace_messages
- project_activity
- notifications
- portfolio_projects
- portfolio_media
- professional_verifications
- verification_documents
- reviews
- business_accounts
- vendor_products
- vendor_enquiries
- vendor_orders

- All public tables have Row Level Security enabled.
- Auth user creation triggers profile and business-account creation.
- Foreign-key indexes were added for participant and ownership queries.
- Overlapping permissive SELECT policies were consolidated.
- Storage buckets: project-files (private), portfolio-media (public), verification-documents (private).
- Storage object policies enforce first-folder ownership and project participant reads.
- Database security advisor reports one project-level warning: leaked-password protection is disabled.
- No table-level security findings remain after hardening.

Production, QA, and handover

Deployment and evidence summary

- Next.js 16 production build completed with 51 routes and no TypeScript errors.
- Vercel deployment completed successfully and aliased to `sajivo-app.vercel.app`.
- Production and preview environments contain the Supabase URL and publishable key.
- Production login authenticated against Supabase and redirected to the client dashboard.
- A real project publish, proposal destination, and private attachment upload were verified.
- Client-to-vendor cross-role navigation redirected back to the permitted client dashboard.
- A retailer role was tested against the protected live-data dashboard and then reverted.
- Security advisors were rerun after migrations; only Auth leaked-password protection remains to enable in the Supabase dashboard.
- Email confirmation remains on; the QA account was manually confirmed solely for workflow testing.
- The supplied Vercel token should be rotated because it was shared in conversation.

DELIVERED

Connected Supabase project • protected roles • production deployment • 15-page evidence report
